CERTIFICATE

This is to certify that the project entitled “**Food Security and Nutritional Support Prediction**” submitted in partial fulfilment of Minor Project (MCA461P) of III Semester MCA is a result of the Bonafide work carried out by Lakshmisagar J M (1RV23MC048) during the Academic year 2024-25.

Prof. Chandrani Chakravorty
Assistant Professor
Department of MCA
RV College of Engineering®
Bengaluru-59

Dr. Jasmine K S
Associate Professor and Director
Department of MCA

DECLARATION

I, Lakshmisagar J M (1RV23MC048) student of Third Semester MCA hereby declare that the Minor Project titled “**Food Security and Nutritional Support Prediction**” has been carried out and completed successfully by us and is our original work.

Date of Submission:

Signature of the Student

Lakshmisagar J M (1RV23MC048)

ACKNOWLEDGEMENT

The satisfaction of achieving milestones in any endeavour is significantly amplified by acknowledging the invaluable contributions of those who supported, encouraged, and guided us throughout the process.

We extend our sincere appreciation to Dr. K N Subramanya, Principal, RV College of Engineering®, for his continuous support and encouragement.

Special thanks are due to Dr. Jasmine K S, Professor & Director, Department of Master of Computer Applications, for her unwavering support and insightful guidance.

We extend our heartfelt gratitude to our internal guide, Prof. Chandrani Chakravorty, Assistant Professor, Department of MCA, RV College of Engineering®, for her unwavering support, encouragement, and guidance throughout the project.

We are also grateful to all teaching and non-teaching staff members who graciously responded to our requests and provided essential assistance, without which the successful completion of this minor project would not have been possible.

Finally, we express our gratitude to everyone involved, directly and indirectly, whose collective efforts and support have been instrumental in its successful execution.

Lakshmisagar J M (1RV23MC048)

ABSTRACT

The agricultural sector, a cornerstone of food security and economic stability, contributes significantly to India's GDP, with an estimated global market size of over \$12 trillion. Despite technological advancements, nutrient deficiencies in crops continue to pose a challenge, especially in states like Karnataka with diverse agro-climatic zones. This study targets these challenges by employing data-driven methodologies to identify nutrient imbalances and devise actionable solutions. Emerging opportunities in predictive analytics and machine learning pave the way for optimizing agricultural planning. Existing algorithms, such as regression modelling for trend analysis and nutrient exchange frameworks, offer a theoretical foundation for this project. However, they are often constrained by the absence of localized solutions that address both deficiencies and surpluses efficiently. This gap motivates the present work, aiming to enhance nutrient adequacy and crop productivity through innovative, district-level interventions.

The methodology involves the integration of district-level crop production data, nutrient composition, and dietary requirements specific to Karnataka. Python libraries like pandas and scikit-learn are used for data preprocessing and modelling, while linear regression is employed for production trend projections. A unique nutrient surplus-deficit exchange mechanism is developed to optimize inter-district nutrient distribution. Assumptions such as a uniform annual growth rate of 5% and consistent dietary needs are incorporated to guide the analysis. The study is carried out in a sequence involving data preprocessing, deficiency identification, prediction modelling, and the development of surplus-exchange policies.

Preliminary results indicate significant nutrient deficiencies across age groups in Karnataka, with the potential for a 15% reduction in these deficiencies through targeted crop recommendations and inter-district nutrient exchanges. The nutrient exchange framework demonstrates an efficiency of over 85% in matching surpluses to deficits. Additionally, the 5-year production projections support agricultural planning by highlighting growth trends for key crops. These findings underscore the project's ability to advance sustainable agriculture and nutrition, laying the groundwork for future enhancements such as real-time monitoring and AI-driven optimization systems
